The sciences of ACEs and Attachment: Insights into their shared history in Scotland and beyond

Overview

Why does a society need to focus on ensuring children have warm, attentive relationships with adults? Why is that crucial for healthy emotional development?

These are the questions Simon Partridge and Suzanne Zeedyk addressed in a set of papers they published in 2021. Because the articles appeared in an academic journal, many members of the public missed their publication. This document was created in 2023 in order to help a wider audience share in discussions about the links between the sciences of ACEs and attachment.

The paper by Suzanne Zeedyk tells the story of Scotland's ACEs movement, which began in 2005 and burgeoned unexpectedly in 2017. Her central point is that this movement is grounded in an emphasis on the importance of relationships.

The paper by Simon Partridge, written as an editorial, traces previously unrealised links between attachment theory, led by Dr John Bowlby starting in the 1930s, and the more recent science of Adverse Childhood Experiences (ACEs), which emerged in the 1990s. Partridge's discovery is that the same terminology has been used by both. Recognising this history helps when thinking about how the insights from these two areas can be put into practical use.

This document provides insights into the ways in which organisations and individuals throughout Scotland and beyond are striving to put relationships at the centre of their practice and policy. It is hoped the story will be of value not only to Scottish citizens, but to anyone seeking inspiration from a story of unfolding cultural change.

The document contains content from the following three articles and relevant photographic illustrations.

The history of Scotland's ACEs movement: Grounded in a focus on relationships

Suzanne Zeedyk

Abstract

As 2021 commences, Scotland finds itself in the midst of a dynamic movement driven by awareness of the science of Adverse Childhood Experiences (ACEs). That drive comes from unparalleled grassroots interest as well as moves toward reform in public services. This paper traces the history of Scotland's ACEs journey, published, to our knowledge, for the first time in an academic journal. The start of the movement is dated to 2005, when the newly founded Violence Reduction Unit adopted a developmentally informed, public health approach to reducing Scotland's high rate of violence. In 2017, a national tour of the documentary film *Resilience* sparked widespread public engagement. It is demonstrated that, from the outset, the Scottish movement has been grounded in a focus on relationships. This aligns it with an attachment perspective, posing an interesting contrast with the epidemiological origins of the ACE Study itself and the associated movement that has since emerged in the USA. The significance of this distinction has received insufficient consideration, perhaps because the trajectory of the Scottish ACEs movement has not been apparent. This article provides that narrative and reflects on its theoretical and practical implications.

Introduction

As 2021 begins, Scotland finds itself in the midst not only of a global pandemic but also a dynamic ACEs movement. This paper traces the history of that movement, underway now for almost two decades.

The paper highlights the focus on relationships that is a core feature of that movement. Its presence would be easy to overlook or take for granted, but, arguably, it has been key to its success. A relational focus carries both theoretical and practical significance, in that it provides an explanation of the impacts of Adverse Childhood Experiences [ACEs] and identifies actions, at the personal and societal levels, that can be taken to prevent, mitigate and heal those impacts. A multitude of examples now exist that illustrate how awareness of the science of ACEs has transformed personal lives, professional practice and institutional policies, across a range of sectors in Scotland. The lessons we have learned can hopefully be of use to other regions engaged in their own ACEs journeys.

I write the paper as one individual whose voice has become prominent within this movement. My aim is to convey the Scottish story to those unfamiliar with it. I feel a responsibility in my account to the many others who have engaged in this journey, and I recognise that others might have offered alternative perspectives. I have chosen to frame the account in four phases. They do not run strictly chronologically, but this structure conveys a sense of the diverse developments that occurred over time. Those phases are discernible only in hindsight. What now appear as beginnings felt, at the time, simply like grasping opportunities. There is a lesson even in that.

A public health approach to violence: 2005 - 2016

The beginning of Scotland's ACEs journey can most clearly be dated to 2005, with the establishment of the Violence Reduction Unit. Two members of Strathclyde Police, Detective Chief Superintendent John Carnochan and Head of Intelligence Analysis Karyn McCluskey, with the resolute backing of their Chief Constable Willie Rae, sought to understand the violence that had plagued Glasgow for decades. The city had been dubbed the 'murder capital of Europe', with rates of knife crime and gang violence at record levels. Carnochan and McCluskey's growing appreciation of the intersections between poverty, childhood adversity, stress and intergenerational trauma led them to the startling conclusion that violence should be viewed as a public health issue (Armstrong, 2018). The idea that violence could be approached through a lens other than criminal justice was one that unsettled critics and that was surprising even to them. As Carnochan (Leask, 2015) later commented: "I had never [before] consciously thought about why there was so much violence. I just presumed that's what it was like and that it was my job to deal with it."

The work of the World Health Organisation (WHO) was essential to their shift in perspective. The WHO's contention was that violence was not inevitable, but preventable, and that relationships early in life were a key component of that prevention (World Health Organisation, 2004). Carnochan and McCluskey's (2019) attention to the science of early brain development led them to describe experiences of emotional safety in childhood as a "vaccine" against future violence. They combined this with evidence from other domains, such as gang membership, masculinities, community cohesion and, in time, the Adverse Childhood Experiences Study (Felitti & Anda, 1998). They were further assisted by work in the mental health field in Scotland, which was already arguing that the predominant zero tolerance approach to violence in the workplace should be replaced by a frame that saw it as a function of interpersonal conflict (Paterson, Miller & Leadbetter, 2005). The central theme drawing these diverse literatures together was the fundamental importance of relationships. They were advocating for "caring people into change" (Geoghegan, 2015). It was a brave stance for anyone affiliated with the police to take, and they weren't afraid of the controversy it sometimes brought, such as the newspaper headlines when Carnochan (2015) called for funding of more health visitors as opposed to more police officers. The focus of these two leaders on early relationships meant, in effect, that they were reclaiming Bowlby's attachment insights, even if they rarely employed that terminology.

Carnochan and McCluskey's ability to hold their position was bolstered by the appointment of Harry Burns as Chief Medical Officer of Scotland in 2005. Coming from a background as a surgeon and then public health specialist, Burns' core theme was wellbeing. He regularly explained attachment theory to audiences, albeit using the language of 'stress' rather than Bowlby's 'proximity seeking'. He wove this into an account of deindustrialisation, community disintegration, poverty and poor health outcomes, such as shockingly high incidences of heart disease, cancer and early mortality. He was highlighting the same patterns traced in the ACE Study. Ultimately, Burns was trying to make the case for "connectedness" as the path to human wellbeing (Hetherington, 2014). That is why he was such an active advocate of initiatives focused on childhood, such as the multi-agency Early Years Collaborative introduced in 2012 (Scottish Government, 2018a), and the ethos of 'Getting It Right For Every Child' (GIRFEC; Scottish Government, 2014), Scotland's national approach to improving the wellbeing of children and young people

The strategy crafted jointly by Burns, McCluskey and Carnochan was, in part, to foster cross-sector, public conversation about what a public health approach to violence might look like. That was facilitated through events such as the international conference hosted by the Violence Reduction Unit in 2007, based at the Police Training College. The venue held symbolic importance, as did the explicit partnership with the WHO's Violence Prevention Alliance. The event was supported by Scottish Government and attended by several hundred people, amongst them senior civil servants, ministers, community activists and myself. One of the invited speakers was Dr Vincent Felitti, speaking about the ACE Study, which had at that point been undertaken a decade previously. Some years later, McCluskey (2018a) would say that she wished she had better understood what she was hearing as she listened to him speaking.

Other speakers were emerging on the national scene in Scotland. Examples include Tina Hendry (McCluskey, 2020), a serving police officer who founded the charity ReAttachment to educate others about the impact of childhood trauma. She had come to understand it as a result of her personal experience as a kinship carer, resulting in her oft-quoted statement: "Poor outcomes are not inevitable." Alan Sinclair (2018), economist and CEO of the employment organisation The WISE Group, spoke frequently of the links between experiences in the early years and the development of basic employment skills, such as arriving at work on time and negotiating conflict. James Docherty (2019), mentor with the Violence Reduction Unit, used his personal and professional experience of violence, addiction recovery and childhood distress to highlight ways that teachers and other adults in his childhood had failed to help because of their interpretations of his 'challenging behaviour'. Dr Michael Smith (2018), an associate medical director for mental health services, worked to raise awareness of ACEs especially amongst practitioners and policymakers. His links with the Glasgow Centre for Population Health resulted in an influential seminar delivered by Jane Stevens, founder of the US-based ACEs Connection Network, in April 2016. I had begun providing public lectures on 'the science of connection', drawing on my experience as a developmental psychologist and research scientist at the University

of Dundee. The topic of attachment was frequently included, although the traditional terminology of ‘security and insecurity’ was replaced with the metaphoric language of ‘sabre tooth tigers and teddy bears’ (Zeedyk, 2020).

These details are important because, in order to understand the origins of Scotland’s ACEs journey, there is a need to recognise what was fomenting at the time and to appreciate the emerging influence of disparate voices. There was at ‘the beginning’ no specific vision for an ACEs movement. There was, instead, talking and thinking and determination. During the decade 2005-2017, several hundred thousand people will have been exposed to the idea that childhood experiences hold long-term consequences. If those experiences are scary or stressful, without adult relationships to provide emotional reassurance, then the consequences are likely to be worrying ones, not only for those individuals but for society as a whole. It was an insight straight out of the pages of Bowlby, even if his name was not common parlance. Later, I would describe this as a period of “tilling the cultural soil” (Zeedyk, 2019).

Grassroots groundswell: 2017 - present

The summer of 2017 became a landmark moment in Scotland’s grassroots awareness of ACEs. The shift stemmed from the documentary film on ACEs, *Resilience: The Biology of Stress and the Science of Hope* (KPJR Films, 2016). The film had dropped into fertile cultural soil.

The Scottish Premiere of the film, held on 29 April 2017 in Glasgow, was a sell-out. The date had been chosen to follow the London premiere on 27 April, hosted by the film’s UK distributors, Dartmouth Films. This timing allowed the film’s director, James Redford, and representatives of the producers, KPJR Films, to be present at both events (Cocozza, 2017). The Scottish premiere had been conceived and organised as a collaboration between two small organisations already working to educate the public about trauma, ReAttachment (led by Tina Hendry) and *connected baby* (led by myself). The level of interest was a surprise. Within days of posting notice of the screening on social media, tickets had sold out. Pressure mounted to hold a follow-up screening in Edinburgh. When that too sold out in days, the two teams found themselves involved in a spontaneous, strenuous national tour.

Over the course of two months in summer 2017, *Resilience* was shown in 25 Scottish communities, with screenings held in cinemas, school gyms, church halls and community centres. Each screening was followed by a discussion panel with individuals from the local area who could speak in some way to the issue of childhood trauma. There was no coordinated plan and no external funding, merely public demand. By the end of the tour, 2500 people had seen the film (*connected baby*, 2018). Many of them returned to their places of work to lobby their employer or their local government representative to purchase a license for the film so that it could be screened more widely within their community. NHS Health Scotland (2018) ensured that professionals from a broad range of sectors had opportunities to view the film. A screening held at the Scottish Parliament Building in January 2018, attended by a range of politicians, generated interest that would help lead to

the establishment of a cross-party working group on ACEs in June 2018 (Scottish Parliament, 2018). It became impossible to keep track of audience numbers, but social media posts suggested that over ensuing months 30,000 or more people were likely to have seen the film. An explosive national conversation was underway. Later, Sara Dodds (2017), Adviser on ACEs at the Scottish Government, would acknowledge the crucial contribution of the film in sparking that public conversation.

A range of other grassroots initiatives emerged that summer. The ACEs Scotland Forum was established on Facebook, attracting 4000 members within weeks. Community ACEs Hubs were set up by individuals keen to spread awareness within local areas. Their activities included public talks, screenings of *Resilience*, meetings with local politicians and social media engagement. The Community Hubs functioned as a network of support for one another, although it is important to note that the network was not formalised in any way. Each hub emerged and operated independently, inspired by their awareness of activity in other communities. Some hubs were led by individuals with professional connections (e.g., teachers, social workers, public health officers) and others by those whose interest was more personal (e.g., parents, individuals with lived experience of trauma). NHS Health Scotland gave support and advice wherever needed. A survey in 2020 revealed that 35 Community Hubs were operating in some capacity across the country (Hetherington, 2020).

One of the organisations inspired by this grassroots activity was TIGERS Ltd, under the leadership of Pauline Scott. TIGERS (Training Initiatives Generating Effective Results Scotland; www.tigersltd.co.uk) delivers apprenticeships to young people, across four sectors: construction, early years, business administration, and information technology. Scott was already familiar with attachment theory, due to her involvement with the early years sector, but her rapidly deepening understanding of the long-term consequences of childhood stress led her to reconceive the framework for her whole organisation. She shifted the primary focus from training in industry skills to nurturing emotional intelligence, arguing that TIGERS' core business was developing the potential of young people. The fact that TIGERS identifies as a commercial enterprise made Scott's actions unusual, especially when she began working to disseminate ACE awareness within the business sector. Her experience was that most business leaders had absolutely no awareness of the impacts of childhood trauma or the fact that many of their employees would be carrying them. She believed that the example set by her team had the potential to change that.

In 2018 and 2019, the teams at TIGERS and *connected baby* came together to host two major ACEs events, each of which attracted around 2000 attendees. The 2018 conference had a bold title: 'Making Scotland the World's First ACE-Aware Nation'. The question underpinning the event was how it might be possible to help every citizen of Scotland to become aware of the long-term impacts of childhood trauma, as a means of driving culture change. They were instinctively following the relational path laid down earlier by McCluskey, Carnochan and Burns. They too were asking: What kind of nation did Scotland want to be? What was the place of connection and caring in our collective identity? The event was filled with speakers who could speak to those themes. The science of ACEs

The sciences of ACEs and Attachment: Insights into their shared history in Scotland and beyond

was, in a sense, secondary. It became a means of addressing those questions. The event asked: could we become a nation that paid closer attention to children's distress and, in the process, solve many of our enduring societal problems? All the conference materials were emblazoned with what became a lasting strapline: 'Believing in the transformative power of compassion'. In the delivery of that event, the collaborative initiative known as 'ACE Aware Scotland' was born, coordinated by TIGERS and *connected baby*.

What was it that had brought about such an unusually large gathering? Although a multitude of organisations within the public and charitable sectors were already working diligently to reduce childhood suffering in Scotland, an event of this size, with 2000 people amassed in a single room to address childhood suffering, was unique. Its appeal can arguably be attributed to the impact of the film *Resilience*. The invited keynote speaker was Dr Nadine Burke Harris, the leading global ACEs advocate, later to be named California's first Surgeon General. There was great anticipation in the crowd at the opportunity to hear her speak in person. That excitement would not have existed had the public not first come to 'know' her through her passionate contributions to the film *Resilience*. She brought scientific depth to the sense of possibility that was burgeoning across the country.

In June 2019, a second major ACEs event was held, this time featuring the keynote speaker Dr Gabor Maté. Once again, the focus was on compassion, the healing nature of relationships, and the power of hope. The title *ACEs to Assets: Fostering Resilience in a Stressed Culture* was intended to convey the message that emotional wounds can become a strength, if the pain that caused those wounds is not left unresolved. It was made clear that the conference had been the vision of two trauma survivors, James Docherty and Kim McGuigan, each of whom shared some of their personal story from the stage. They hoped the event would deepen and extend the core ACE-aware message of relationships, inclusion and healing. Their contributions helped the public to understand the intention of the event and signalled that voices of lived experience occupy a core place in ACE Aware Scotland's values. Those voices are too often excluded from society and the formal systems delivering services.

In 2020, with the country in a series of lockdowns due to Covid, ACE Aware Scotland pursued a different strategy to reach the public. A monthly series of high-level conversations was organised. They were free and available online for anyone to attend from anywhere in the world. They brought to the public leading speakers on provocative topics at the heart of the international ACEs movement. Where do human rights sit within an ACEs agenda? How can the stresses induced by poverty and inequality be addressed? How important is the language chosen to talk about human suffering? What responsibility do employers in the private sector carry for becoming trauma-informed? Why does Scotland continue to have the highest rate of drug deaths in Europe? These are questions familiar to academics and policymakers, but too often the public does not have access to such conversations. They become the recipients of others' decisions. One aim of ACE Aware Scotland events has been to strengthen people's beliefs that they too can be leaders. They can drive change in their communities.

ACE Aware Scotland sought from the beginning to disseminate their work as widely as possible. Digital resources were created, with videos of all major presentations made freely available on a YouTube channel (ACE Aware Scotland, 2018). These were supplemented with an interview series 'Stories of Resilience', in which individuals from a range of sectors told stories about how ACE-awareness had changed their professional practice or personal lives. At the time of writing this piece, the YouTube channel contains almost 100 videos, uploaded over a three-year period, with the total viewing figure approaching 335,000. This figure demonstrates the level of public hunger for this information.

The expansion of the movement brought more debate. Critiques were advanced on a range of issues, including: limitations of the ACEs model; the risk of individualism resulting from an emphasis on biology; insufficient attention to poverty and structural inequality; confusion in terminology; methodological and ethical problems of ACEs scoring and screening; gender and class stereotyping; and suspicions about the motivations of ACEs activists (e.g., Barrett, 2018; Davidson, Critchley & Wright, 2020; Kelly & Zeedyk, 2019; Marshall, 2019). The critiques were published in the mainstream press, in academic and professional journals, on social media and in specially organised events. Although the tone sometimes became personalised and accusatory, the debate has largely served to push people to think more deeply about the core question: what needs to happen to enable Scotland to get better at recognising and addressing the distress carried by so many children and adults?

The international impact of Scotland's grassroots efforts is not easily apparent, thus briefly tracing it is useful. The organisation Connected for Life, based in Northern Ireland, watched the summer success of the Scottish *Resilience* tour and fashioned a similar tour for their communities in the autumn of 2017, culminating with the first ever ACEs Conference in Northern Ireland in November 2017 (Connected for Life, 2018). Individuals from throughout the UK (and beyond) attended the major events of 2018 and 2019, returning to their communities determined to find ways to drive public conversation. The Dutch group ACE Aware Netherlands (www.aceaware.nl) was founded in 2020, inspired directly by developments they witnessed in Scotland. The London ACEs Hub (www.londonaceshub.org), also founded in 2020, has stated they too drew inspiration from Scotland's example. Individuals from Australia, New Zealand, Turkey, Portugal, Canada and America are amongst who regularly tune in to broadcasts or stream video resources. None of this was anticipated when a Glasgow venue was first booked in 2017 for an unknown film called *Resilience*. We have travelled a long way in a short time.

Government and public sector activity: 2016 - present

The efforts of the Scottish Government and affiliated public bodies to engage with the science of ACEs have also been extensive. In 2016, the seminal report 'Polishing the Diamonds' (Couper & Mackie, 2016) was commissioned on behalf of the Directors of Public Health and published by NHS Health Scotland (now Public Health Scotland, as of 2020). The report advocated a public health approach to addressing childhood adversity

and trauma. It resulted in a national conference of 200 delegates in November 2016 (NHS Health Scotland, 2017), chaired by Sir Michael Marmot, author of 'The Marmot Review' (Marmot, 2010), which identified next steps. One of these was establishing a Scottish ACEs Hub, a multi-sector advisory group that could spread awareness and collect best practice responses. The conference became a call to action to ensure that all professional sectors were trauma informed. This goal was assisted by the development of the National Trauma Training Programme (2016), overseen by NHS Education for Scotland and funded by Scottish Government, which aimed to implement trauma informed practice across the whole of the Scottish workforce, regardless of sector.

All of these efforts are classic examples of a public health approach, which seeks to prevent and respond to the causes of ill health and inequality. Public Health Scotland's position is that ACEs should be seen within the wider context of adversity that children face, in particular poverty, inequality and exclusion. One of the key strengths of the ACEs research and terminology has been, in their view, that it provides a bridge between professions, "a shared language about how early life can impact on later social, health and economic life outcomes" (Hetherington, 2020, pg 12).

The First Minister for Scotland (Nicola Sturgeon) first viewed the film *Resilience* in September 2017, at a screening organised by the peer mentoring group Women 1st, supported by children's charity Children 1st (Glasgow, 2017). As part of that event, attended by approximately 300 people, Nicola Sturgeon chaired a panel discussion, in her role as a constituency MSP, in which she re-affirmed her commitment to addressing childhood adversity. In March 2018, a collaborative event was hosted by the Deputy First Minister to reflect on progress being made in regard to ACEs. It was attended by a wide range of Government ministers and officials, as well as a range of individuals interested in progressing activity focused on ACEs, including ambassadors for the Year of Young People (Scottish Government, 2018b). Specific reference to ACEs has been made in the Government's formal Programme for Government for each of the years 2017, 2018 and 2019 (Scottish Government, 2017; 2018c; 2019). Notably, each of these documents features images of children on the cover, which signals a sense of hope for many observers. The Government continues to work on the ACEs agenda (Scottish Government, 2020b), with one of the most recent developments being publication of the first data set on the prevalence of ACEs in the adult Scottish population (Scottish Government, 2020c).

Public bodies, at both the local and national levels, have taken action that draws on this national conversation. For example, NHS Highland chose to focus their 2018 Annual Report on the topic of ACEs (NHS Highland, 2018). The report was shared more widely amongst the public than would usually be the case for reports from a public health agency. Police Scotland embarked on training officers in trauma, with the Ayrshire Division first to show *Resilience* to all 850 of its officers in 2018 (Alderson, 2018). Community Justice Scotland focused extensively in their 2018 Annual Report on the impact of ACEs in relation to justice (Community Justice Scotland, 2018). The Scottish Prison Service included questions about ACEs in their 2017 Prisoner Survey (Scottish Prison Service, 2017). Local authorities such as

Argyll and Bute (2019) and Highland Council (2018) held cross-sector events, reminiscent of those featured in *Resilience*, designed to strengthen integration amongst services serving children and families. The Independent Care Review, a four-year review initiated in 2016 to undertake a root and branch investigation of why Scotland's care system seems to fail so many of its children, drew on the knowledge of trauma to make sense of what it was uncovering (Duncan, 2020). When Education Scotland (2020a) released their new practice guidance for the early years sector in 2020, entitled 'Realising the Ambition', the warmly welcomed document contained explicit references to both adverse childhood experiences and to attachment, including within the Foreword written by the Minister for Children and Young People. Other work by Education Scotland (2018; 2020b) directly addresses questions about how ACEs could be addressed within the school environment, particularly by putting relationships and compassion at the heart of culture and practice.

It would be impossible to provide a comprehensive account of all the instances in which the language and insights of ACEs and trauma have been applied within Scotland's public sector services. My aim has been to give a sense of the breadth of its reach within a short time. Our nation remains a long way from achieving system transformation, where relationships become the standard lens through which policy is designed and implemented. However, for a country where it has sometimes been said that "we tolerate our children more than we like them" (Sinclair, 2018), the change underway is very encouraging.

Changing professional practices: 2017 - present

The story of the Scottish ACEs movement would be incomplete without highlighting the way in which professional practices are shifting spontaneously. The increase in relational practices has been so broad that 'practical applications' can now be regarded as one key aspect of the Scottish movement's character. Understanding trauma through a relational lens gives individuals and organisations the confidence to drive change themselves, without waiting for formal policy decisions. These are the 'early adopters' described in innovation theory (Rogers, 1962), whose leadership is crucial to driving wider culture change. I will limit my considerations to three sectors: education, health and law.

A striking number of primary and secondary schools are developing trauma-informed practices. The enthusiasm is so high that when an independent learning festival was organised at Portobello High School in 2018, under the title 'Meeting the needs of all our young people? ACEs realities and responses', its 300 seats sold out (McKay, 2018). The Portobello Learning Festival is already regarded as a regular fixture in the Scottish educational calendar. Clydebank High's efforts to develop a whole school culture of stress awareness has resulted in their expertise being sought internationally (Diamond, 2020). Boclair Academy responded to student stress during the Covid pandemic by instituting a 'toast break', the apparent simplicity of which is belied by the trauma-informed lens they use to explain it (Morgan, 2020). Bainsford Primary revoked their behaviour policy and replaced it with a relationship agreement (McCafferty, 2019). Pitteuchar East Primary replaced the common phrase of 'challenging behaviour' with that of 'distressed behaviour'

(Knussen, 2019), a linguistic shift has since been spreading across schools in Scotland (Foster, 2020). A partnership of three primary schools in West Lothian created what they call ‘teddy bear policies’ as a means of boosting children’s self-regulatory capacities (ACE Bear Schools, 2020), resulting in one of their teddies being named amongst Scotland’s Top Ten Educational People of the Year in 2019 (Hepburn, 2019). “Furball’s presence [amongst these ten people] symbolises changing attitudes to adverse childhood experiences in Scotland.” These practice changes have resulted from the combination of a relational policy context and grassroots confidence.

In health, there has been a very intentional commitment within various systems and regions to adopt a trauma-informed approach. For example, in 2018, the board members of NHS Ayrshire and Arran (2018) confirmed their plans to take forward ACEs work across the whole of the health board. The paper proposing that strategy was entitled ‘The State of Child Health: Adversity is not Destiny: Population Lens on ACEs’. The progress report one year later (Ayrshire and Arran NHS Board, 2019) confirmed more than 50 screenings of the film *Resilience* had taken place, with the evidence concerning the long-term impacts of adversity increasingly recognised as “compelling” by staff and within services. The report urged continued progress toward organisation-wide culture change in the “underlying assumptions” that are often made about patients and toward collective leadership that acknowledges “trauma is everyone’s business”. Another example of changes within the health sector relates to the training of nurses. All institutions of higher education providing nursing education in Scotland have committed to prioritising trauma-informed models of care (Gilliver, 2018). This is a national approach, across all forms of nursing. The University of Stirling has been a leader in this regard since 2013, with its relational model for training mental health nurses now regarded as best practice (Young, et al, 2019). When one listens to nursing students extemporaneously using language embedded in attachment principles and ACE awareness, the profound impact of this paradigm shift becomes clear (University of Stirling, 2017). “Hearing a person’s story matters so much. To ‘do no harm’, you must know harm.”

Changes in the Scottish legal landscape show a similar pattern. In 2021, a group of four lawyers based in separate law practices, specialising in criminal defence, family law and immigration, combined forces to establish the group ‘Trauma Aware Lawyers in Scotland’ (Rutherford & Bone, 2021). They were motivated by the conviction that lawyers and courts need a better understanding of ACEs. One of their members, Iain Smith, was named Lawyer of the Year in the 2020 Scottish Legal Awards for his efforts (Cameron, 2020). Another, Nadine Martin, worked with her firm Harper Macleod in 2018 to host a screening of *Resilience* for practising lawyers (Martin, 2018). A growing number of Scottish solicitors now seek to have reports on childhood trauma submitted as part of a defence case. The Scottish Sentencing Council is currently reviewing sentencing guidelines and is consulting on how best to take account of contemporary science on brain development, including under conditions of toxic stress (O’Rourke, et al, 2020). Community Justice Scotland, established in 2016, with Karyn McCluskey as CEO, has played an influential role in shifting the Scottish justice

landscape, using scientific evidence about human development to argue for ‘smart justice’ as a counter to criticisms about the risk of ‘soft justice’ (McCluskey, 2018b). Such discourse has made it possible for Iain Smith (2019) to talk with confidence about the propriety of Scottish judges “presiding with kindness”. While these ideas may initially sound counter-intuitive, the science of ACEs helps sceptics to see how relational approaches can play a role in reducing crime. It becomes clear that the justice system will remain unjust until it takes account of childhood trauma.

Professional practices such as these offer vivid illustrations of the success of the Scottish ACEs movement. It is not at all unusual to overhear people quoting one particular line from the film *Resilience* as an affirmation of what is happening. “If we can get the science into the hands of the general population, they will invent very wise actions” (KPJR Films, 2016).

ACEs through an attachment lens

The challenge of providing a history is deciding which details to include and which to omit. My aim has been to describe the broad groundswell that has swept the Scottish public since the 2017 *Resilience* tour and to place that in the context of the decade that preceded it. The most important insight is the relational focus that has been present from the outset.

That relational grounding matters because it speaks directly to current criticism of the ACEs model. Commentators such as Perry (e.g., Hambrick et al, 2018; Perry, 2018) and Gold (2017) are concerned that the ACEs account is insufficiently relationally informed. While it may work as epidemiology, they see it as inadequate developmental theory. An ACE score is regarded as too simplistic. It decontextualises events from a child’s wider environment and life experiences, in particular the presence of relationships that can buffer against toxic stress, as well as the developmental timing of the events. That gap leaves it unable to account for variance in the way that adverse experiences affect individuals, and they regard this as a significant theoretical flaw.

How does that perspective change when the ACEs account is situated not simply within its epidemiological origins of 1998, but within an attachment framework stretching back to the 1930s? Partridge (2021) has made this case, pointing out that Bowlby was the first to use the phrase ‘adverse childhood experiences’ in the 1980s, more than a decade before Felitti and Anda also chose it. Partridge (2019, pg 113) argues that “if Bowlby had lived a little longer, he would not have been surprised by [their] discovery and would have welcomed it.” The link between the two frames can already be found in the empirical literature, such as reflections by Smith and colleagues (2016) on the causes of excess mortality in Scotland. “The relationship between the experience of adversity and attachment style is particularly important, since each may influence the other.” I believe the majority of those engaged with the Scottish ACEs movement, either professionally or personally, intuitively view ACEs through an attachment lens, whether or not they articulate it in this way. It is certainly the view I hold, as a developmental psychologist.

Scotland’s relationally informed ACEs movement is valuable because it demonstrates the viability of an ACEs approach that is both theoretically rich and practically useful. It is

unsurprising that this theoretical depth has gone unexplored at the grassroots level, given that such nuances are difficult to unpack in boisterous public debates. I hope space for that can be created soon, as it would yield at least three benefits. First, it would shine a light on little-recognised differences between the orientations of the Scottish movement (i.e., relational) and the American ACEs movement (i.e., epidemiological). Second, it would disentangle tensions around ACEs screening, which Harris has implemented in California (Underwood, 2020), but which Scottish public health officials have argued against (Public Health Scotland, 2021). Finally, it would speak to the mistaken belief that an ACEs narrative suggests definitive links between childhood trauma and adult outcomes. That has been consistently countered within the Scottish ACEs narrative, as reflected not only in policy statements, but in the quote that has become a legacy of Tina Hendry's activism in Scotland. It bears repeating: "Poor outcomes are not inevitable." After Hendry's untimely death in 2020 (McCluskey, 2020), badges with that quote were distributed at her funeral to hundreds of her supporters. This serves as yet another illustration of the potency of the culture change underway in Scotland.

Scotland holds other historic gems that may help in bridging the gap between ACEs and attachment theory. John Bowlby is buried on the Isle of Skye, where he spent much loved summers with his family. James Robertson, whose work between 1950 and 1980 changed hospital policies so that children no longer suffered by being separated from parents, was born in Rutherglen, just outside Glasgow. The psychoanalytic theorists Ian Suttie and Ronald Fairbairn, unknown to the general public but essential to the development of Bowlby's thinking about infant experience, were born and based in Scotland. The American researchers who first developed the ACEs model, and the American activists who have done so much to promote it, may be largely unaware of this relevant British history. The Scottish ACEs movement has deep roots. There is more for its activists to build on than many yet realise.

Conclusion

Our country faces many challenges. We are a long way from being an ACE-aware nation, where all five million of our citizens fully appreciate that the way children are treated leaves a biological impact on the way they develop. It is still too easy to create divisive narratives of exclusion, with trauma constructed as something that happens to 'other people over there', rather than something that unites us as human beings. Too many people continue to feel - and to be - unheard, isolated, excluded. The Covid pandemic will have increased the frequency of ACEs. This information is needed now more than ever.

That is why the determined sense of hope within the Scottish movement is cherished. In her keynote speech at the ACE Aware Nation conference, McCluskey (2018) reflected on the many hills that had to be climbed after she and Carnochan first suggested that loving babies could help to cut crime. She quoted the words of philosopher Adam Smith, who shaped Scotland's Enlightenment of the 18th century. "No society can surely be flourishing and happy, of which the greater part of the members are poor and miserable." She described this era as a new Enlightenment, predicting that "in ten years' time, people will hold Scotland up and say, 'Look what they did.'"

It is, though, the reflection provided by mental health specialist Brodie Paterson (2021) that perhaps provides the most poetic account of the Scottish movement's success:

"The philosopher Foucault suggests we should think of history as a series of happenings, sometimes quick, sometimes slow, sometimes happening over generations. Particular combinations of events create the conditions of possibility without which future events cannot happen. This is, I think, the ACEs movement in Scotland. Our mental health team knew about the ACE Study from very early on, but despite considerable effort, could gain no traction in mainstreaming the issues. It took the development of an ACE community to do that."

ACEs has given Scotland a shared language for talking not only about the distress of trauma, but also about the power of relationships.

Acknowledgements

My thanks go to the following individuals, all of whom have been involved in Scotland's ACEs movement, for comments on earlier drafts of this paper: Sally Amor, Adam Burley, David Cameron, John Carnochan, James Docherty, Sara Dodds, Mary Glasgow, Graham Goulden, Katy Hetherington, Pete Kinnear, Fiona Larkin, Karyn McCluskey, Simon Partridge, Brodie Paterson, Gary Robinson, Pauline Scott, Iain Smith and Jennie Young.

Editorial:
What happened to you?
Attachment theory extended

Simon Partridge

The contemporary Adverse Childhood Experiences (ACEs) movement grew out of the ACE Study (Felitti et al., 1998) initiated by Drs Vincent Felitti and Robert Anda around 1995¹. As my article published in *Attachment*, June 2019, showed, the term “adverse childhood experiences” was not coined by Dr Felitti, but was first used by Dr John Bowlby in a lecture given in the spring of 1981 in New York at the invitation of the American Orthopsychiatric Association. It was then published in their journal in October 1982. When I wrote to Dr Felitti in November 2020 and pointed this out I received this response: “The term ‘Adverse Childhood Experiences Study’ has indeed caught on around the world, Mr Partridge. When I chose the title around 1995 or 1996, I had no idea that something about the phrase would be so engaging.”²

It appears that Felitti had no prior knowledge of Bowlby’s use of the term. He had invented the same term in the light of his empirical observations while working as a paediatrician and specialist in preventive health at the non-profit Kaiser Permanente (KP) health maintenance organisation in San Diego, California.

The origins of the ACE Study lie in observations that the astute and vigilant Felitti made of many of the patients whom he was treating for obesity (there are strong parallels here with Bowlby’s intuitive, pre-WWII recognition of a connect between delinquency and maternal deprivation). The connection with childhood experiences of sexual abuse became too numerous to ignore, and then were confirmed by some of his colleagues (see note 1). There was a fortuitous crossing of paths at an obesity conference in 1990 with a staff member, an expert in epidemiology, at the federal public health Centers for Disease Control and Prevention (the equivalent of Public Health England). By 1995 this had led to the field research work for the study among some 17,000 patients on the books of Kaiser Permanente (KP). This selected for study the effects of the ten most common trauma stressors that Felitti had found in his clearly middle-class (KP is non-profit but insurance financed) obesity population. Each ACE scored one, giving a possible total of ten.

The sciences of ACEs and Attachment: Insights into their shared history in Scotland and beyond

- emotional abuse (recurrent)
- physical abuse (recurrent)
- sexual abuse (contact)
- physical neglect
- emotional neglect
- substance abuse in the household
- mental illness in the household
- mother treated violently
- divorce or parental separation
- criminal behaviour/incarceration in the household.

The results were startling and given the size of the sample beyond reasonable doubt. They revealed the unrecognised prevalence of ACEs; then their strong dose-response relationships (the more the worse), often decades later, to adult emotional problems, self-harming coping mechanisms like addiction, medical diseases, and premature death. Four ACEs puts one in a high risk zone, for example, prone to complex PTSD³. And life expectancy is likely to be reduced by twenty years if one scores six+ ACEs! The binary distinction between psyche and soma was largely dissolved; the area of psychosomatics greatly enlarged.

As a result of this innovatory and compelling work, Felitti and Anda were invited to many speaking engagements including presentations to Congress, state legislatures, and a wide range of community organisations and institutions. This included an invitation to Glasgow in July 2007, where Dr Felitti spoke at the Scottish Police College at a conference hosted by the Violence Reduction Unit and the World Health Organization (WHO). The conference was supported by the Scottish Government and attended by many senior civil servants and Ministers (see Zeedyk, 2021). The spread of ACEs information was, from 2012, strongly amplified by two highly successful websites created by the journalist-publisher Jane Stevens: www.PACEsConnection.com and www.ACEsTooHigh.com. These have now been joined by other information hubs internationally, including in Scotland, Wales, Ireland (both parts), and the regions of England, most recently at the London ACEs Hub – www.londonaceshub.org.

For the first ten years of its existence the promotion of an ACEs approach relied on the ACE Study, the educational work of Felitti and Anda, and a series of more detailed follow-up studies. It was not until Felitti was invited to write the foreword to a compendium by cutting-edge experts, titled *The Impact of Early Life Trauma on Health and Disease: The Hidden Epidemic* (Lanius et al., 2010)⁴, that a more theoretical approach started to appear from within the ACEs orientation. The fact that Felitti was invited to write a foreword to such a prestigious publication indicates the seriousness with which the findings of his study were by then being taken in psychotherapeutic and medical circles. In the foreword Felitti moves beyond medical observation and the findings of the comprehensive epidemiological survey, and asks some fundamental questions about how human beings develop, even calling in aid from the poet T. S. Eliot and mentioning psychoanalysis. Here he reveals not

only his intellectual curiosity but his imagination. Indeed, he summarises *The Impact of Early Life Trauma on Health and Disease* as setting out:

our current approaches to understanding how we get to be the people we are: not only as biological entities, but also as truly human beings with an outer persona and an inner soul. Just as we observe how a leg damaged in childhood sometimes does not grow to full potential, this book asks how does a persona or soul become damaged. (p. xiii)

A little further on he suggests:

The turning point in modern understanding of the role of trauma in medical and psychiatric pathology is commonly credited to Freud, who lived within the lifetimes of many of us, as did René Spitz and Harry Harlow with their ground-breaking work on *maternal deprivation*. (my emphasis, p. xiv)

Now I think that most psychologically informed readers of this last sentence in Britain and Ireland would immediately spot a glaring omission: John Bowlby.⁵

I believe the time has now come to recognise that early deprivation lies at the root of most childhood adversity and its later manifestations. The time has come to link the Felitti/ Anda and Bowlby traditions together in a way that was prefigured in Bowlby's lecture and subsequent article way back in 1981/82 – and thus strengthen both. Indeed, I feel it is a matter of regret such a meeting never happened in reality, since it appears that they would have had much to share.

That article was originally published in America under the title "Attachment and loss: retrospect and prospect" (Bowlby, 1982), but the English version was republished in 1988 as "The origins of attachment theory" (Bowlby, 1988). In some ways the article is the most concise summary of Bowlby's mature formulation of attachment theory. In the article he uses the word "adverse" no less than ten times! And he ends with a precise summary, gleaned from decades of research and observation, of the dynamics which underlie the playing out of ACEs:

Thus *adverse childhood experiences* have effects of at least two kinds. First they make the individual more vulnerable to later adverse experiences. Secondly they make it more likely that he or she will meet with further such experiences. Whereas the earlier adverse experiences are likely to be wholly independent of the agency of the individual concerned, the later ones are likely to be the consequences of his or her own actions, actions that spring from those disturbances of personality to which the earlier experiences have given rise. (1988, pp. 36–37, my emphasis)

The two-phase process of ACEs described by Bowlby is captured in the original ACE Study questions in the distinction between the primary traumas and the household dysfunctions in which those so traumatised often live (see above). This double whammy (at least) is delivered first unconsciously and second more consciously, frequently ending in the

The sciences of ACEs and Attachment: Insights into their shared history in Scotland and beyond

familiar personal or interpersonal destructive scenario. The two traditions join hands here in identifying the toxic mixture which derails many developing personas and psyches, and the regulation of their bodily functions (I can speak from personal experience) – now substantiated by modern neuroscience and endocrinology. The result: enormous suffering and ill health; the hidden pandemic indeed!

Between 2010 and about 2016 something pretty amazing started to happen on the ACEs front. Felitti and Anda had never kept their “good news” just to medical and professional circles, but around the middle of the 2010s ACEs burst out of the exam room into the general community. This was no doubt aided by digital means of communication and the internet which simply weren’t available in Bowlby’s day, which social journalist Jane Stevens exploited well with her websites. But it was actually the rather conventional medium of the film documentary which sent ACEs sky-rocketing. James Redford, son of Hollywood’s Robert Redford, an independent progressive film-maker who had been through troubles of his own, got the message. In 2016 he released his resulting film *Resilience: The Biology of Stress and the Science of Hope* about the effects of early toxic stress, informed by the science of the ACE Study and further neuroscience developments. It packaged the evidence in an attractive and accessible form and was deliberately used as an awareness-raising and organising tool. That would surely have appealed to Bowlby who, as regards James Robertson’s 1952 film, *A Two-Year- Old Goes to Hospital* (which he encouraged Robertson to make), said: “influential though the written word may often be, it has nothing like the emotional impact of a movie” (Bowlby, 1982, p. 665). As we know, Robertson’s film became a catalyst in radically altering the way children were treated in hospitals; they are no longer separated from their mothers.

By 2017 Redford’s film had crossed the Atlantic and had its British premiere at Leicester Square, central London, on the 27th April, with a Q&A led by him and Dr Graham Music, child and adolescent psychotherapist at the Tavistock Clinic. A couple of days later it moved north to Scotland providing the prime mover for a massive ACEs Aware conference in Glasgow in September 2018 aiming, no less, than to make Scotland the first “ACE aware nation” (see Zeedyk, 2021) – seeds were also sown in other parts of Britain and Ireland. My own interests were kindled around this time, and I also fortuitously again met pioneering trauma therapist Dr Felicity de Zulueta who had taken an interest in my work as a boarding school survivor, whom I discovered had a similar interest in ACEs. With her and other pioneers, and inspired by the Scottish example, this has led to the London ACEs initiative. The ACEs conference focused on the London city region we had planned for March 2020 was unfortunately postponed by Covid-19. This will be reconvened online in September 2021 – details at <https://www.confer.uk.com/event/aces.html>.

As Bowlby found to his cost among his psychoanalytic colleagues, the introduction of radical new ideas has a deeply unsettling effect on some. The same has been true with the ACEs approach (see Zeedyk, 2021). On the whole this has been a concern about the way the original ten ACEs questions (others have since been added – for example, the World Health Organization version recognises stressors like historic trauma, social violence, and

systemic discrimination) have been used. There is ongoing debate around this, but we probably need to make a clearer distinction between ACE scores in an epidemiological setting and their use for screening and routine enquiry in a clinical setting. There is every evidence that Felitti has applied his insights in a sensitive way with his patients, as does the well-known ACEs activist Dr Nadine Burke Harris (2018; Partridge, 2019a, 2019b), now Surgeon General of California State – and so should we all.

It seems to me that in the wake of the Covid-19 pandemic our human primate species has never been more aware of how toxic stress affects both our bodies and our minds. Or perhaps there was a somewhat similar feeling at the end of WWII when there was a determination not to go back to the austerity and privations of the 1930s, and the senseless destruction of war. Then, as now, there was a widespread feeling that we should “build back better”. Bowlby and his colleagues at the Tavistock Clinic in London, which became part of the new National Health Service, saw themselves as very much involved in this post-war progressive tradition⁶. Likewise, I would like to suggest that those currently involved in succouring human well-being, whether professionals, survivors, or community enablers, now gather under the growing banner of the ACEs movement. The ACEs movement reiterates the progressive intentions of Bowlby and his colleagues. It puts at the heart of families and societies the need for safety and secure attachment, and wills the resources to achieve this. It seeks to prevent through good primary care and peer group support many of those ills of adversity appearing in the first place.

It seeks causes of illness not in the all too familiar refrain of, “What’s wrong with you?” but in the empathic inquiry, “What’s happened to you?”. This opens up the possibility of some co-produced answers, at many levels. In upending the usual assumptions of individual illness, and blurring the over-rational Cartesian distinction between body and mind, it will shift the blaming-shaming game which still underpins so much of our consumer-oriented, hyper-individualised society. By establishing attachment security as the hallmark of the “good society” there is the prospect we can greatly reduce childhood adversity and even over time make it a spectre of the past. The pioneering Californians, led by Dr Harris, principal speaker at the 2018 Glasgow ACEs conference, now the first ever Surgeon General of the State and backed by the Governor, aim to reduce the incidence by half within a generation⁷.

Why can’t we be similarly ambitious? If not now, when?

Dedication

This editorial and Suzanne Zeedyk's article are dedicated to the memory of ACEs pioneers Jamie Redford (film-maker) and Tina Hendry (Scottish campaigner). Both died, much too young, in 2020 from cancer. We are grateful for the innumerable ways in which their legacies live on.

Acknowledgements

Suzanne Zeedyk for her commitment to ACEs, unbounded enthusiasm and intellectual encouragement. Mary Emerson-Smith for her enthusiasm of Dr Felitti, and felicitous turn of phrase. Colleagues in the London ACEs Hub for mutual support. And the editor for her gentle coaxing.

2. Email from Dr Felitti, dated 19 November, 2020, 8:23:54 p.m.
3. See Michael Salter and Heather Hall, "Reducing shame, promoting dignity: a model for the primary prevention of complex post-traumatic stress disorder", *Trauma Violence & Abuse*, 20 December 2020, which provides evidence of the close link between the occurrence of c-PTSD (ICD-11, WHO, 2018) and being exposed to four or more ACEs—https://www.researchgate.net/profile/Heather_Hall22/publication/345313978-Reducing_Shame_Promoting_Dignity_A_Model_for_the_Primary_Prevention_of_Complex_Post-Traumatic_Stress_Disorder/links/5ff27b1f45851553a0198910/Reducing-Shame-Promoting-Dignity-A-Model-for-the-Primary-Prevention-of-Complex-Post-Traumatic-Stress-Disorder.pdf?origin=publication_detail (accessed 26 January 2021).
4. I drew this compendium in 2012 to the attention of Kate White, acting editor of *Attachment*, and it had a feature length review in *Attachment: New Directions in Psychotherapy and Relational Psychoanalysis*, 6(1), July 2012: pp. 101-121. One of the reviews was by me from a survivor perspective, though I have to admit I didn't appreciate the full importance of Felitti at the time.
5. In an interview with Alice Smuts in 1977, Bowlby himself provides an explanation for this omission:

Harlow's work had a completely different inspiration ... His work was, as I understand it, inspired by René Spitz's work. I may have said this before—I think one can't place too much emphasis on geography. You know, traditions which are immensely important in the States are of no consequence over here; traditions which are immensely important over here are of no consequence in the States. And it is fair to say that as regards maternal deprivation and all that sort of thing, in this country it's associated with my name and in the States it's associated mostly with Spitz's name. (Duschinsky, R. & White, K. (2020). *Trauma and Loss: Key Texts from the John Bowlby Archive*, pp. 201-202)

It is worth noting that both Spitz and Bowlby were influenced by the unorthodox Hungarian psychoanalyst Sándor Ferenczi, who was a pioneer in recognising the importance of the mother-infant dyad and the traumatic effects of infant abuse. He recuperated Freud's "seduction theory" and was then excommunicated, like Bowlby, from orthodox psychoanalysis.

6. For a comprehensive overview of this post-war intersection of psychoanalysis, attachment theory and social policy, see Michal Shapira's fascinating *The War Inside: Psychoanalysis, Total War, and the Making of the Democratic Self in Postwar Britain*, Cambridge: Cambridge University Press, 2013. The final chapter takes a close look at Bowlby's and James Robertson's influence.

**ATTACHMENT AND LOSS:
Retrospect and Prospect**

John Bowlby, MD

Honorary Consultant Psychiatrist, Tavistock Clinic, London

An historical sketch of the manner in which evidence has accumulated showing the ill effects of separation, loss, and maternal deprivation during the early years, and of how, in the light of this evidence, a new conceptual framework, often referred to as attachment theory, has been formulated for understanding personality development and psychopathology.

Presented at the American Orthopsychiatric Association's 1981 annual meeting, in New York

664 0002-9432(82)040664-7\$3.00 15 1982 American Orthopsychiatric Association, Inc

RESEARCH

Nothing has been so rewarding as the immense amount of careful research to which the early work on maternal deprivation has given rise. The literature is now enormous and far beyond the compass of an account of this sort to summarize. Fortunately, moreover, it is unnecessary since a new, comprehensive, and critical review of the field has recently been published by Rutter,⁶⁸ who concluded by referring to the "continuing accumulation of evidence showing the importance of deprivation and disadvantage on children's psychological development" and expressing the view that the original arguments "have been amply confirmed." A principal finding of recent work is the extent to which two or more adverse experiences interact so that the risk of a psychological disturbance following is multiplied, often many times over. An example of this interactive effect of adverse experiences is seen in the findings of Brown and Harris,²⁴ derived from their studies of depressive disorders in women.

Not only is there this strongly interactive effect of adverse experiences, there is also an increased likelihood for

... people brought up in unhappy or disrupted homes are more likely to have illegitimate children, to become teenage mothers, to make unhappy marriages, and to divorce.⁶⁸

Thus, adverse childhood experiences have effects of at least two kinds. First, they make the individual more vulnerable to later adverse experiences. Sec-

ondly, they make it more likely that he or she will meet with further such experiences. Whereas the earlier adverse experiences are likely to be wholly independent of the agency of the individual concerned, the later ones are likely to be the consequences of his or her own actions, actions that spring from those disturbances of personality to which the earlier experiences have given rise.

Of the many types of psychological disturbance that are traceable, at least in part, to one or another pattern of maternal deprivation, the effects on parental behavior and thereby on the next generation are potentially the most serious. Thus a mother who, due to adverse experiences during childhood, grows up to be anxiously attached is prone to seek care from her own child and thereby lead the child to become anxious, guilty, and perhaps phobic.¹⁷ A mother who as a child suffered neglect and frequent severe threats of being abandoned or beaten is more prone than others to abuse her child physically,²⁸ resulting in the adverse effects on the child's developing personality recorded by, amongst others, George and Main.³⁴ Systematic research into the effects of childhood experiences on the way mothers and fathers treat their children has only just begun and seems likely to be one of the most fruitful of all fields for further research. Other research leads are described in a recent symposium edited by Parkes and Stevenson-Hinde.⁵⁹

The sciences of ACEs and Attachment: Insights into their shared history in Scotland and beyond

ACE-Aware Scotland

ACE-Aware Scotland emerged in 2018. Led by a collaborative effort between two organisations, *Tigers* and *connected baby*, it built on the energy established in 2017 during the *Resilience* tour. Dr Nadine Burke Harris, a key figure in the film, was invited as key note speaker at a national conference with an ambitious title: *Making Scotland The World's First ACE-Aware Nation*. Every year since, ACE-Aware Scotland has hosted a large event, drawing hundreds of attendees and featuring an international speaker. The aim is to build public awareness of the lifelong impact of childhood trauma. The quote badges from all speakers have become valued symbols of involvement, and the strapline a statement of ethos.

“Scotland’s relationally informed ACEs movement is valuable because it demonstrates the viability of an ACEs approach that is both theoretically rich and practically useful. It is unsurprising that this theoretical depth has gone largely unexplored at the grassroots level, given that such nuances are difficult to unpack in boisterous public debates. I hope space for that can be created soon, because...ACEs has given Scotland a shared language for talking not only about the distress of trauma, but also about the power of relationships.”

Suzanne Zeedyk, 2021

“The ACEs movement reiterates the progressive intentions of Bowlby and his colleagues in the mid-twentieth century. It puts at the heart of families and societies the need for safety and secure attachment, and it wills the resources to achieve this. It seeks to prevent, through good primary care and peer group support, many of those ills of adversity appearing in the first place....If not now, when?”

Simon Partridge, 2021

“Thus, adverse childhood experiences have effects of at least two kinds. First, they make the individual more vulnerable to later adverse experiences. Secondly, they make it more likely that he or she will meet with further such experiences.”

John Bowlby, 1982
